Hiring Team
Apple

Dear Hiring Team,

The first computer I ever touched was an Apple IIe, and it has shaped what I think good software should be ever since — well made, unobtrusive, and genuinely in service of the person using it. That is why I am applying for the iOS Software Engineer, Siri Devices position: the chance to build exactly that, at the company that set the standard. Over 25 years I have shipped production software across .NET/backend engineering, AI-agent infrastructure, cloud, and security — most recently building Model Context Protocol (MCP) servers and autonomous agents and architecting ML pipelines for an AI startup — and I would bring that range, and a strong bias toward shipping working software, to the Siri team.

What draws me to this role is that exposing capabilities to an AI assistant through secure, well-defined interfaces is exactly what I build. My open-source Model Context Protocol (MCP) servers do for AI agents what App Intents and SiriKit do for Siri — describe a capability's schema, validate every invocation, and give the model a safe, structured way to act on the user's behalf. I work daily with tool-use / function calling, multi-provider LLM routing, and RAG, and I recently landed three merged security fixes to Omnigent, an open-source meta-harness for AI agents, hardening input validation, authentication, and policy enforcement around exactly this kind of tool-calling surface. It is real code you can read today at github.com/CryptoJones. I watched this year's WWDC sessions closely, and the Foundation Models framework's new Language Model protocol — one API you can swap Apple's own model, Claude, or Gemini behind, with Dynamic Profiles to switch on the fly — is exactly the pluggable, multi-provider model routing I already build into my own agents; getting to contribute to that inside Siri is what excites me most about this role.

Just as important, the way I build maps to how Apple builds. I run inference locally and privately on my own hardware rather than shipping user data to a third-party API, and I harden every interface I expose — my MCP servers follow NSA security guidance, with per-invocation guards and audit logging. That privacy-first, security-conscious instinct, plus 25+ years of shipping production software and a habit of clear technical writing, is what I would bring to making Siri integrations that feel reliable and trustworthy. I am a fast study in a new stack — I have shipped across C#/.NET, Python, TypeScript, and Java — and I am eager to go deep on Swift and the App Intents framework.

Willing to Relocate to Seattle for Apple. I would welcome the chance to talk about how I can contribute to the team.

Thank you for your time and consideration.

Sincerely,

Aaron K. Clark
