Hiring Team
Apple

Dear Hiring Team,

The first computer I ever touched was an Apple IIe, and it shaped what I think good software should be ever since. That's why I'm applying for the Applied AI Software Engineer - Vision Products Group & Siri position.

Over 25 years, I've shipped production software across .NET/backend, AI-agent infrastructure, cloud, and security, most recently building Model Context Protocol (MCP) servers and autonomous agents and architecting ML pipelines for an AI startup. Exposing capabilities to an AI assistant through secure, well-defined interfaces is exactly what I build. My open-source MCP servers do for AI agents what App Intents and SiriKit do for Siri: a schema, validation on every call, and a safe way for the model to act for the user.

I work daily with tool-calling, multi-provider LLM routing, and RAG, and I recently landed three merged security fixes to Omnigent, an open-source agent harness, hardening input validation, authentication, and policy enforcement. It's real code you can read today at github.com/CryptoJones. I watched this year's WWDC sessions, and the Foundation Models framework's new Language Model protocol lets you swap Apple's model, Claude, or Gemini behind one API with Dynamic Profiles. That's the same multi-provider routing I already build into my own agents.

The way I build maps to how Apple builds. I run inference locally and privately on my own hardware rather than shipping user data to a third-party API, and my MCP servers follow NSA security guidance with per-invocation guards and audit logging. I've shipped C#/.NET, Python, TypeScript, and Java; I haven't shipped Swift yet, but I'm a fast study and ready to go deep on it and App Intents.

Willing to Relocate to Cupertino for Apple. I would welcome the chance to talk. Could we set up a short call?

Thank you for your time and consideration.

Sincerely,

Aaron K. Clark
