Hiring Team
Apple

Dear Hiring Team,

The first computer I ever touched was an Apple IIe, and it shaped what I think good software should be ever since. That's why I'm applying for the Applied AI Software Engineer - Vision Products Group & Siri position.

Applied AI on Siri runs under real privacy and security constraints, and that's already how I build. I run inference locally and privately on my own hardware instead of sending user data to a third-party API, and I harden everything I expose: my open-source Model Context Protocol (MCP) servers follow NSA security guidance, with per-call validation guards and audit logging. I recently landed three merged security fixes to Omnigent, an open-source AI-agent harness, tightening input validation, authentication, and policy enforcement. Security isn't a side interest for me; it's an OWASP and penetration-testing background I bring to everything I build.

The AI work is what I do every day: tool-calling, multi-provider LLM routing, and RAG. My MCP servers do for AI agents what App Intents and SiriKit do for Siri: a schema, validation on every call, and a safe way for the model to act for the user. It's real code you can read today at github.com/CryptoJones. I watched this year's WWDC sessions, and the Foundation Models framework's new Language Model protocol lets you swap Apple's model, Claude, or Gemini behind one API with Dynamic Profiles. That's the same multi-provider routing I already build into my own agents.

Behind that is 25 years of shipping production software across .NET/backend, AI agents, cloud, and security, most recently building MCP servers and autonomous agents and architecting ML pipelines for an AI startup. I've shipped C#/.NET, Python, TypeScript, and Java; I haven't shipped Swift yet, but I pick up new stacks fast and I'm ready to go deep on it and App Intents.

Willing to Relocate to Cupertino for Apple. I would welcome the chance to talk. Could we set up a short call?

Thank you for your time and consideration.

Sincerely,

Aaron K. Clark
